We Maximize Nature's Potential<sup>®</sup>

**ultim**<sup>®</sup>-ST

consistent Pythium protection

for peas, corn, beans,  
soybeans, wheat, barley  
and oats

For growers seeking relief from *Pythium* disease pressure, **ultim-ST** is a non-biological, copper-activated, fungicide seed treatment that delivers high-count emergence and thicker, healthier plant stands.

### Key Benefits

- Consistent protection from *Pythium spp.*
- Increases emergence rates
- Improves plant vigor
- Helps to establish plant stands
- Backed by third-party trial data

### **Pythium Pressure Just Got Relieved**

In the presence of *Pythium* pressure, regardless of the region, soil temperature, or field, growers and researchers who planted seeds treated with **ultim-ST** for a wide range of crops report:

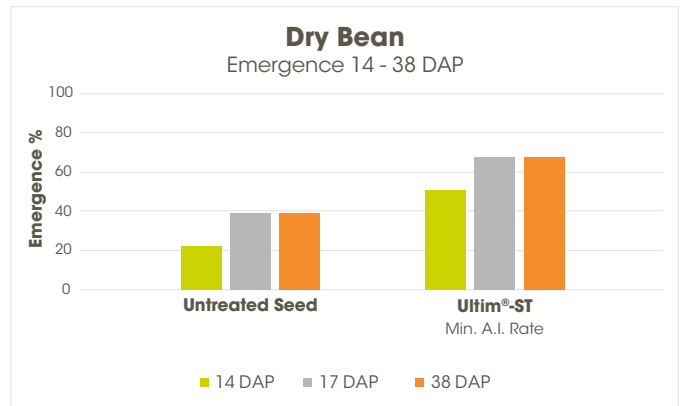

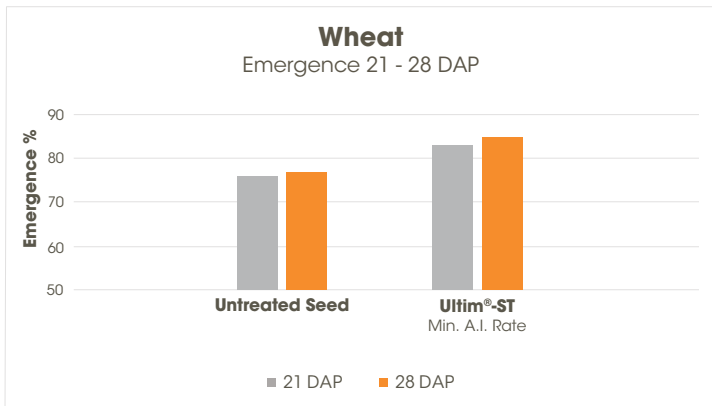

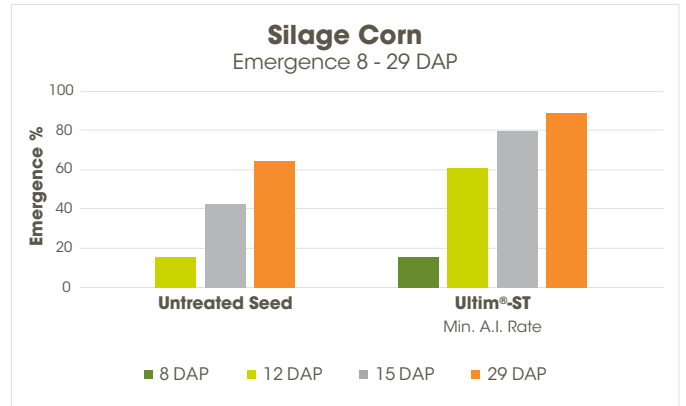

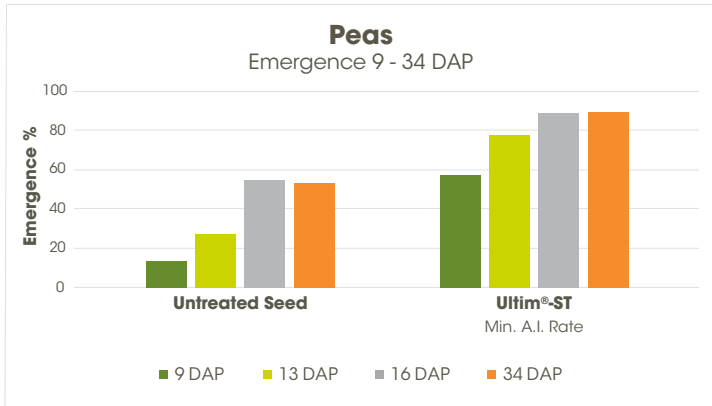

- Increase in overall plant population often with measured higher yields
- Reduces or eliminates the need for replanting or high-density planting
- Cost savings including seed, labor, time, and land resources due to improved emergence and yield

**Consistent Improvement**  
of emergence vs. untreated seeds

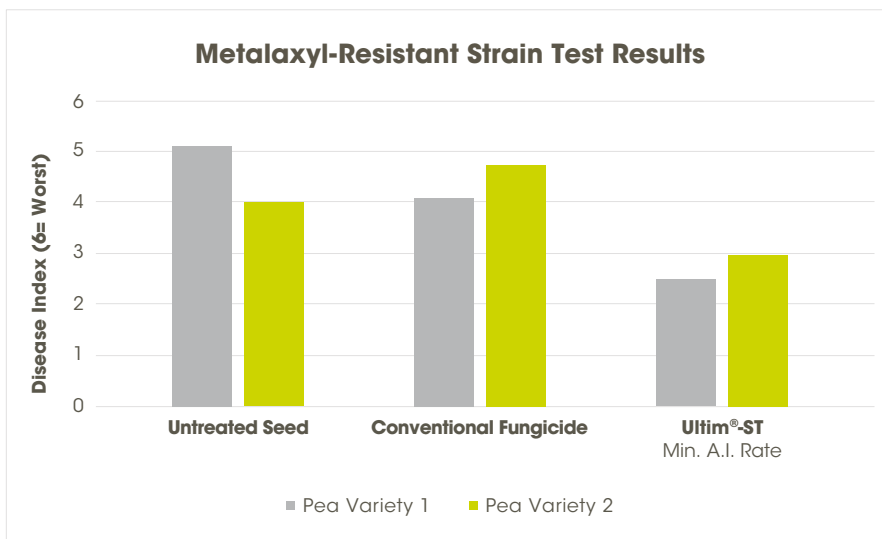

## Third Party Trial Overview

Planting raw seeds in *Pythium* pressure soil is a recipe for disaster for corn, peas, and other crops. However, when seeds were treated with **ultim-ST**, the emergence rates were significantly higher in third-party trials conducted in multiple states. Multi-state varietal trials demonstrate that under *Pythium spp.* disease pressure, **ultim-ST** consistently delivers higher emergence.

## Emergence Trial Results

Please ask a Germain's representative for a copy of our trial data sheets and label for a complete list of registered crops.

**Ultim-ST**  
is effective under  
heavy pressure of  
Metalaxyl-resistant  
*Pythium*.
