

We Maximise Nature's Potential®

Species by Product Overview  
Europe & United Kingdom

# Introducing Germains

---

Germains Seed Technology is committed to delivering industry-leading innovative seed technologies for sugar beet, vegetables and flowers. Specialising in Prime, Pellet, Filmcoat, Health and Polymer seed technology solutions, our team of industry experts are here to work in collaboration with you to deliver value throughout the seed supply chain.

Please contact our dedicated Key Account Managers to understand how we can maximise the potential of your seed.

## Our Seed Technologies

---

### prime

Priming uses a range of processes to improve emergence.

#### **Benefits**

- faster speed of emergence
- improves uniformity to optimise harvesting efficiency
- increases vigour for fast and strong plant development
- increases yield potential
- breaks photo and thermodormancy in a variety of species

### pellet

Pelleting is the process of applying complex coatings to the seed.

#### **Benefits**

- increases the size of smaller, finer seeds to aid precision drilling
- produces smoother, rounder, more uniform seed
- regulates water uptake
- limits direct contact between seed and chemical, minimising any potential phytotoxic effects

### filmcoat

Filmcoating is the process of applying agrochemical treatments or colouring, either directly to the seed or pellet.

#### **Benefits**

- acts as a carrier of fungicides, insecticides and other additives
- reduces chemical spraying in the field, providing environmental, operational and economic advantages
- prolongs pest and disease protection
- colour allows easier identification in the field
- reduces dust

### health

Health is the process of removing pathogens from the seed and adding beneficial products to create a healthy plant.

#### **Benefits**

- eradicates a range of seed-borne pathogens
- creates clean, disease-free, healthy seed
- increases nutrient uptake
- improves vigour
- increases root mass
